

## **Simple Email Service**

## Agenda:

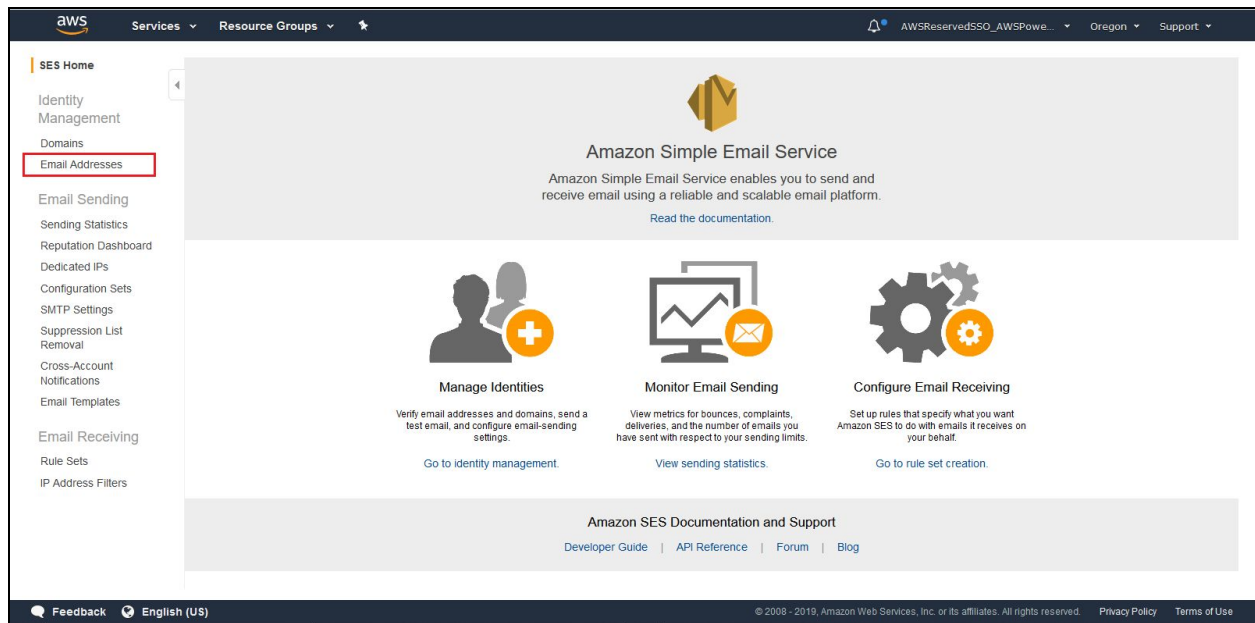

Amazon Simple Email Service is a cloud-based email sending service designed to help digital marketers and application developers send marketing, notification, and transactional emails.

By the end of the document we can able to know how to configure sender email address in AWS SES service.

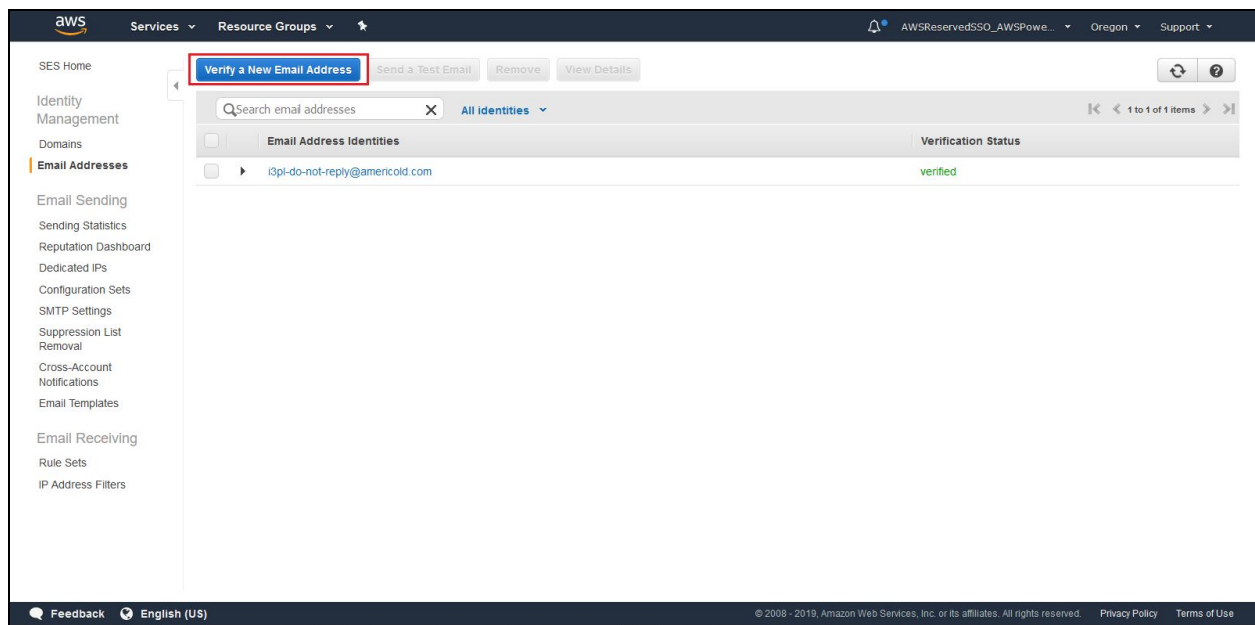

First we need to login into the AWS console and search for **Simple Email Service**.

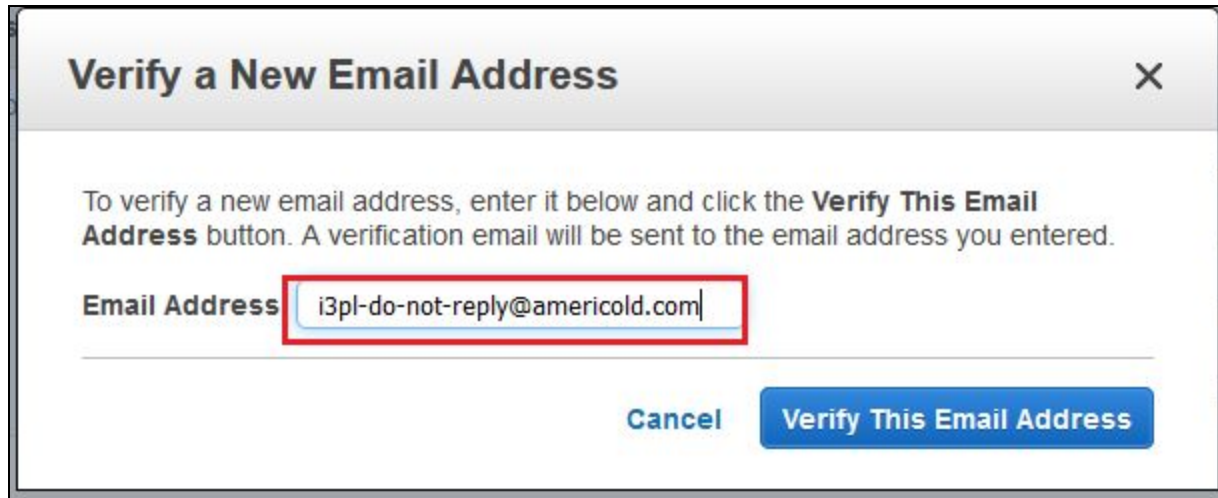

Now go to the Email Addresses on the dashboard as shown below

Now click on the **Verify the new email address** to verify the sender email address.

Enter the sender mail address and click on verify the email address as shown below.

The dialog box is titled "Verify a New Email Address" and contains instructions: "To verify a new email address, enter it below and click the **Verify This Email Address** button. A verification email will be sent to the email address you entered." Below the instructions is a text input field labeled "Email Address" containing the text "i3pl-do-not-reply@americold.com". At the bottom right are two buttons: "Cancel" and "Verify This Email Address".

A confirmation mail is sent to that email address and that should be verified by clicking the accept/confirm that appears on that mail and we can also view the status of the email verification as shown below. Now the sender email address can access from backend application.
